Haynes Tech Book Diesel Repair Guide covers a variety of General Motors and Ford light trucks, vans and cars. The Haynes guide is designed for DIY mechanics or beginners and has a progressive format that starts with basic repairs and works its way up to more complex tasks. The guide is written with simple step-by-step instructions to get home the mechanic through the repair process to provide the perfect results. The fully illustrated guide includes everything from simple repairs through complex maintenance procedures to keeping your Ford or General Motors car running better. The included images, illustrations, and diagrams are designed to enhance instructions and help novice mechanics or those less familiar with diesel engines find and replace components as needed. This guide covers the following General Motors and Ford vehicles: GM 350 cubic meters 5.7 liters, 379 cubic meters. 6.2 litres, and 397 cubic meters. 6.5 litres Ford 420 cubic meters. v. 6.9 litres, 445 cubic meters 7.3 litres and 445 cubic meters v. 7.3 liter Power Stroke. Book Exposure: Diesel Engine Repair Guide GM, Ford V8 Engines HIGH PRESSURE SYSTEM: GENERAL INFORMATION Heart GM 5.7 litres, 6.2 litres, and 6.5 diesel engines is a high-pressure system that supplies the fuel to the combustion chamber. The high-pressure system consists of an injection pump, an injection nozzle and metal lines between the pump and the nozzles. The high pressure system sounds pretty simple in principle, but in fact it's nothing but simple. The high-pressure system performs many functions, much more than a carb or fuel injection system on a car with a gasoline engine. Not only is it a meter - in accordance with the load and speed of the engine - the amount of fuel required for each engine cycle. It must also develop the high pressure required to inject fuel into each cylinder at a certain point in its work cycle (firing order). And it must control the speed at which fuel is injected, sprayed and distributed fuel throughout the combustion chamber, and start and finish each injection cycle dramatically. Obviously, the high-pressure system is quite complex. FLUID LEVEL CHECKS NOTE: Below are checks on the level of fluid that must be made at 250 miles or weekly. Additional fluid level checks can be found in the specific maintenance procedures that follow. Regardless of the intervals, be alert to fluid leaks under the vehicle that indicate a malfunction that needs to be fixed immediately. Fluids are an integral part of grease and cooling systems. As liquids are gradually depleted and/or contaminated during the normal operation of the vehicle, they must be replenished periodically. See the recommended lubricants and liquids at the beginning of this chapter, before add liquid to any of the following components. Note: The vehicle must be at ground level when checking the liquid level. The purpose of this guide is to help you service and overhaul the Ford 6.9L and 7.3L lightweight diesel diesel truck General Motors 5.7L, 6.2L and 6.5L diesel engines are a lightweight pickup truck.
